第7章电感、电容及动态电路

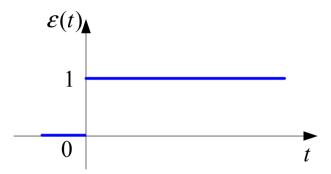

- 7.1 广义函数 Singularity Functions
- 7.2 电容 Capacitor
- 7.3 电感 Inductor
- 7.4 动态电路的暂态分析概述

7.2 单位阶跃函数和单位冲激函数

7.2.1 单位阶跃函数 Unit step function

1、定义

$$\varepsilon(t) = \begin{cases} 0 & (t < 0) \\ 1 & (t > 0) \end{cases}$$

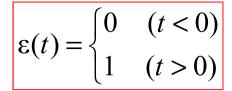

单位阶跃函数 $\epsilon(t)$ 在t=0时刻发生跳变,在t=0时左右极限为:

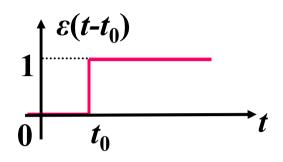

$$\varepsilon(0_{-}) = \lim_{t \to 0_{-}} \varepsilon(t) = 0 \qquad \varepsilon(0_{+}) = \lim_{t \to 0_{+}} \varepsilon(t) = 1$$

2. 用单位阶跃函数表示电压源在时刻t=0作用于电网络,取代开关:

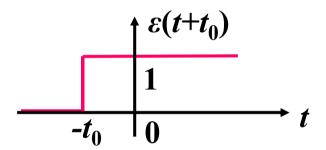

3. 单位阶跃函数的延迟

$$\mathcal{E}(t - t_0) = \begin{cases} 0 & (t < t_0) \\ 1 & (t > t_0) \end{cases}$$

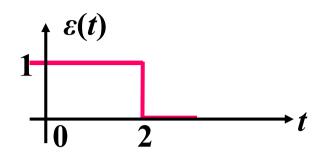

$$\mathcal{E}(t+t_0) = \begin{cases} 0 & (t < -t_0) \\ 1 & (t > -t_0) \end{cases}$$

$$\begin{array}{c}
\varepsilon(t) \\
1 \\
0
\end{array}$$

$$\mathcal{E}(-t) = \begin{cases} 0 & (t > 0) \\ 1 & (t < 0) \end{cases}$$

例ε(-t+2)

$$\mathcal{E}(-t+2) = \begin{cases} 0 & (t>2) \\ 1 & (t<2) \end{cases}$$

4. 单位阶跃函数的主要功能

(1) 定义时间域

$$f(t) = \begin{cases} 0 & (t < 0) \\ \sin \omega t & (t > 0) \end{cases}$$

$$\to f(t) = \mathcal{E}(t) \sin \omega t$$

将一个分段函数用 $\varepsilon(t)$ 表示其定义域写成一个函数。

(2) 截取函数

$$f(t) = Ae^{-2t}$$

$$f(t) = Ae^{-2t}\varepsilon(t)$$
表示 $t > 0$ 的波形

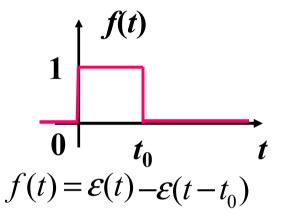

构成闸门函数

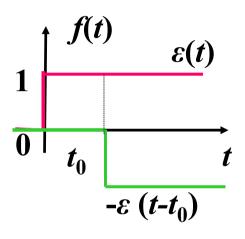

$$f(t) = \sin \omega t$$
在 $0 < t < 2\pi$ 时的波形

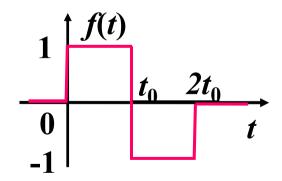

$$\rightarrow f(t) = \sin \omega t [\mathcal{E}(t) - \mathcal{E}(t - 2\pi)]$$

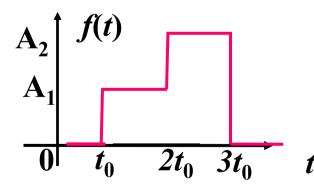

由单位阶跃函数可组成复杂的信号

例

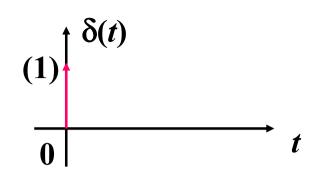

$$f(t) = \mathcal{E}(t) - 2\mathcal{E}(t - t_0) + \mathcal{E}(t - 2t_0)$$

$$f(t) = \mathcal{E}(t) - 2\mathcal{E}(t - t_0) + \mathcal{E}(t - 2t_0) \qquad f(t) = A_1 \mathcal{E}(t - t_0) + (A_2 - A_1)\mathcal{E}(t - 2t_0) - A_2 \mathcal{E}(t - 3t_0)$$

7.2.2 单位冲激函数δ(t)

1、定义

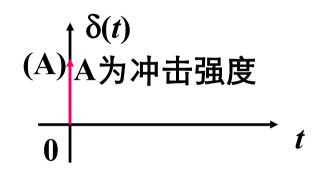

$$\delta(t) = \begin{cases} 0 & t \neq 0 \\ \int_{-\infty}^{\infty} \delta(t) dt = 1 & \int_{0-}^{0+} \delta(t) dt = 1 \end{cases}$$

特征:单位冲激函数 $\delta(t)$ 仅在t=0取值,且其强度为1。

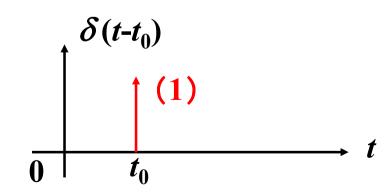

A与 $\delta(t)$ 的乘积仍为冲激函数

$$\int_{-\infty}^{+\infty} A \delta(t) dt = \int_{0_{-}}^{0_{+}} A \delta(t) dt = A$$

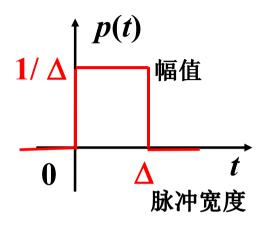

单位冲激函数的延迟 $\delta(t-t_0)$

$$\begin{cases} \delta(t - t_0) = 0 & (t \neq t_0) \\ \int_{-\infty}^{\infty} \delta(t - t_0) dt = 1 \end{cases}$$

2、单位冲激函数 $\delta(t)$ 与单位阶跃函数 $\epsilon(t)$ 之间的关系

$$p_{\Delta}(t) = \frac{1}{\Delta} [\mathcal{E}(t) - \mathcal{E}(t - \Delta)]$$

$$\delta(t) = \lim_{\Delta \to 0} p_{\Delta}(t)$$

$$= \lim_{\Delta \to 0} \frac{1}{\Delta} [\mathcal{E}(t) - \mathcal{E}(t - \Delta)]$$

3、单位冲激函数δ(t)的重要性质

性质 1: $\delta(t)$ 所与任意连续函数f(t)的相乘特性

设f(t)为任意连续函数,则

$$f(t) \cdot \delta(t) = f(0)\delta(t)$$

$$\begin{array}{ccc}
 & \Rightarrow t \delta(t) = 0 \\
 & \Rightarrow f(t - t_0) \delta(t) \\
 & = f(t - t_0) \Big|_{t=0} \delta(t) \\
 & = f(-t_0) \delta(t) \\
 & \Rightarrow f(t) \delta(t - t_0) = f(t_0) \delta(t - t_0)
\end{array}$$

性质2: 筛分性

设f(t)为任意连续函数,则

$$\int_{-\infty}^{+\infty} f(t)\delta(t)dt = \int_{-\infty}^{+\infty} f(0)\delta(t)dt = f(0)\int_{-\infty}^{+\infty} \delta(t)dt = f(0)$$

同理有:
$$\int_{-\infty}^{\infty} f(t)\delta(t-t_0)dt = f(t_0)\int_{-\infty}^{+\infty} \delta(t-t_0)dt$$
$$= f(t_0)$$

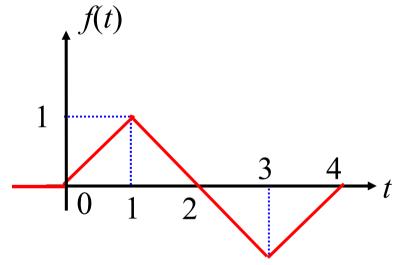

例
$$\int_{-\infty}^{\infty} (\sin t + t) \delta(t - \frac{\pi}{6}) dt = \sin \frac{\pi}{6} + \frac{\pi}{6}$$

用叠加表示分段波形

- 分段表示: 用分段表示法对所有t不能将波形用一个完整的数 学式子表达出来,因而不便进行数学运算。
- 分段叠加表示

将各段波形用闸门函数去截取。然后再相加从而写出完整的函数表达式。

例:

$$f(t) = t[\mathcal{E}(t) - \mathcal{E}(t-1)] - (t-2)[\mathcal{E}(t-1) - \mathcal{E}(t-3)]$$
$$+ (t-4)[\mathcal{E}(t-3) - \mathcal{E}(t-4)]$$

7.3 电容 (capacitor)

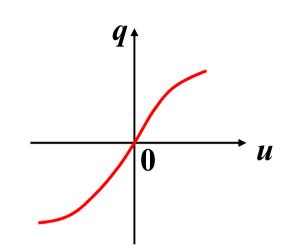

金属片 绝缘介质 电容器的主要电磁性质 引线 电路理论

11

7.3.1 电容元件的q-u特性

电路符号 $u(t) = \begin{pmatrix} + & \downarrow & i(t) \\ +q(t) & \downarrow & +q(t) \\ \hline & C \end{pmatrix}$

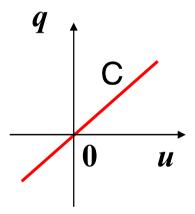

线性非时变电容元件: q-u 特性是过原点且不随时间变化的直线

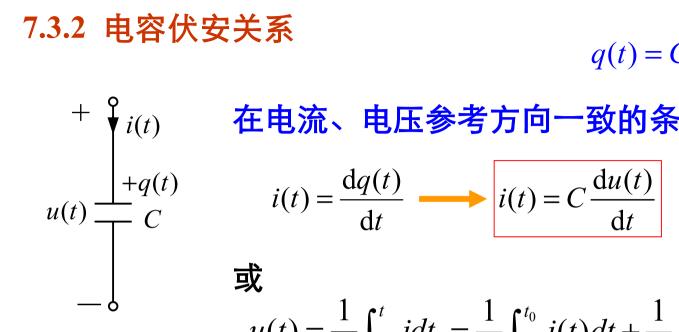

特性方程为: q(t) = Cu(t)

电容 C 的单位: F(法) (Farad, 法拉)

常用 mF, μF, nF, pF等表示。

$$q(t) = Cu(t)$$

在电流、电压参考方向一致的条件下:

$$i(t) = \frac{\mathrm{d}q(t)}{\mathrm{d}t}$$
 \longrightarrow $i(t) = C \frac{\mathrm{d}u(t)}{\mathrm{d}t}$

$$u(t) = \frac{1}{C} \int_{-\infty}^{t} i dt = \frac{1}{C} \int_{-\infty}^{t_0} i(t) dt + \frac{1}{C} \int_{t_0}^{t} i(t) dt$$

$$u(t) = u(t_0) + \frac{1}{C} \int_{t_0}^t i(t) dt$$

$$u(t) = u(0_-) + \frac{1}{C} \int_{0_-}^t i(t) dt$$

- $ightharpoonup t_0$ 表示初始时刻, $U(t_0)$ 为电容电压的初始电压值。
- \triangleright 电容电压等于初始值 $U(t_0)$ 与在时间间隔 $[t_0, t]$ 内电容电流积 分所决定的电容电压之和。

7.3.3 电容的重要性质

1 直流稳态性能

$$i(t) = C \frac{\mathrm{d}u(t)}{\mathrm{d}t}$$

- ▶电容在直流电路中相当于开路,电流为0,电压恒定;
- \triangleright *i*的大小与 *u* 的变化率成正比,与 *u* 的大小无关;

2.记忆特性

$$u(t) = \frac{u(0_{-})}{C} + \frac{1}{C} \int_{0_{-}}^{t} i(t) dt$$

在任意时刻t,电容电压不仅与该时刻电流有关,而且还与i 以前的电流历史状况有关。这一性质称为记忆特性。

3. 电容电压的连续性
$$u(t) = u(t_{0-}) + \frac{1}{C} \int_{t_{0-}}^{t} i(t) dt$$

- ▶电容电流在t₀处为有限值,电容电压就在t₀处连续
- ▶电容电流在t₀处为无限大,电容电压就在t₀处不连续

讨论 t=t0.时,电容电压的连续性

$$u(t_{0+}) = u(t_{0-}) + \frac{1}{C} \int_{t_{0-}}^{t_{0+}} i(t) dt$$

$$u(t_{0+}) = u(t_{0-})$$
连续

$$u(t_{0+}) = u(t_{0-}) + \frac{1}{C} \int_{t_{0-}}^{t_{0+}} \delta(t - t_0) dt$$
不连续

$$u(t_{0+}) = u(t_{0-}) + \frac{1}{C}$$

7.3.4 储能特性

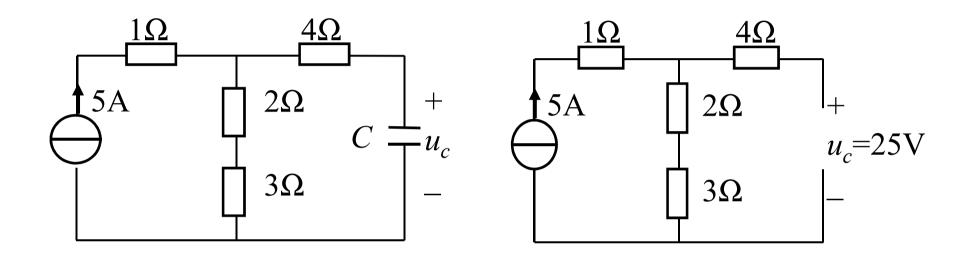

$$p(t) = u(t)i(t) = Cu(t)\frac{\mathrm{d}u(t)}{\mathrm{d}t}$$

$$w(t) = \int_{-\infty}^{t} p(t)\mathrm{d}t = \int_{-\infty}^{t} Cu(t)\frac{\mathrm{d}u(t)}{\mathrm{d}t}\mathrm{d}t = \frac{1}{2}Cu^{2}(t) - \frac{1}{2}Cu^{2}(-\infty)$$

$$w(t) = \frac{1}{2}Cu^{2}(t)$$

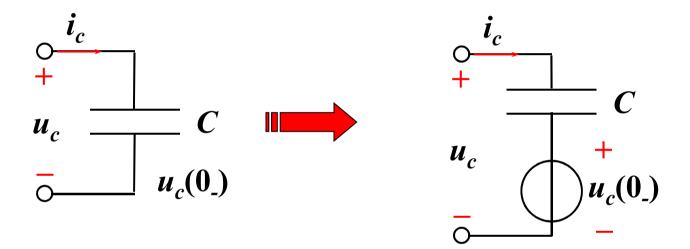

- ➤ 在任一时刻t,电容的能量决定于该时刻的电容电压值。
- ▶ 电容的储能与电容电流无关,当电容的瞬时电流为0,只要电压不为0,能量就不为0。
- ▶ w恒大于0,电容并不产生向外的能量,它是一个无源元件。
- 电容在功率为负时,输出能量为以前吸收的能量。即它能将吸收的能量储存起来,在一定的时刻又释放出去,故电容又称储能元件。电容也是非耗能元件。

【练习】.计算电容电压

7.3.5 线性时不变电容元件的串联、并联与混联

非零初始电压电容元件的等效电路

$$u_C(t) = u_C(0_-) + \int_{0_-}^{t} \frac{1}{C} i dt$$

可用一个电压源和一个无初始值的电容串联代替。

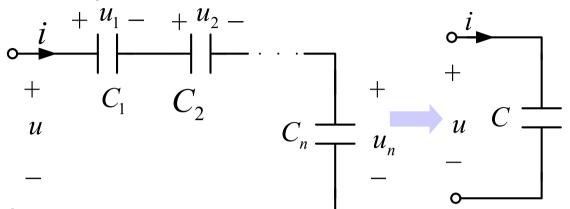

7.3.5 线性时不变电容元件的串联、并联与混联

1、 电容串联 (Capacitor in Series)

$$= \sum_{k=1}^{n} u_k(0_+) + \sum_{k=1}^{n} \left(\frac{1}{C_k} \int_{0_+}^{t} i dt\right)$$
$$= u(0_+) + \frac{1}{C} \int_{0_+}^{t} i dt$$

$$u(0_{+}) = \sum_{k=1}^{n} u_{k}(0_{+}) = \sum_{k=1}^{n} u_{k}(0_{-})$$

$$\frac{1}{C} = \sum_{k=1}^{n} \frac{1}{C_k}$$

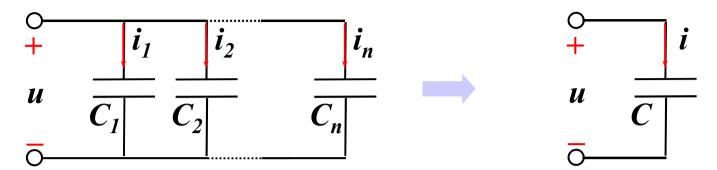

初始值为0的电容串联,各电容 按电容量倒数正比分压。

若
$$u_k(0_-) = 0$$
 $(k = 1, 2, ...)$

$$u_k = \frac{1}{C_k} \int_{0_+}^t i dt \qquad u = \frac{1}{C} \int_{0_+}^t i dt$$

$$u_k = \frac{1/C_k}{1/C}u$$

2、 电容并联 (Capacitor in Parallel)

情况 1: 各电容初始电压均为零

根据KCL可以推出:

$$i = i_1 + i_2 + \dots + i_n$$

$$= C_1 \frac{du}{dt} + C_2 \frac{du}{dt} + \dots + C_n \frac{du}{dt}$$

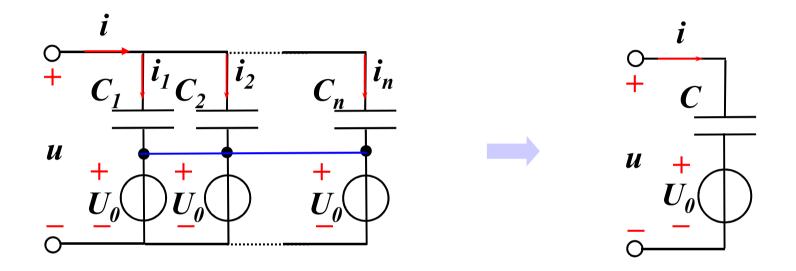

$$= C \frac{du}{dt}$$

$$= C \frac{du}{dt}$$

$$C = C_1 + C_2 + \dots + C_n = \sum_{k=1}^{n} C_k$$

2、 电容并联 (Capacitor in Parallel)

情况2:
$$u_{c1}(0_{-}) = u_{c2}(0_{-}) = \cdots = U_{0} \neq 0$$

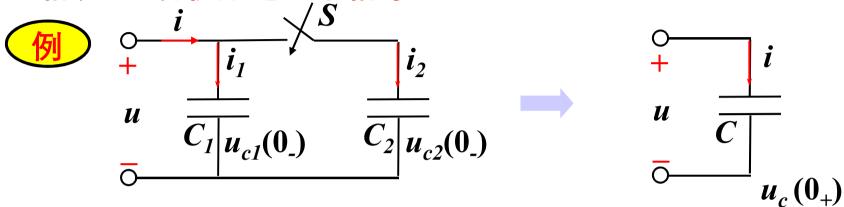

$$C = \sum_{k=1}^{n} C_k$$

$$u_C(0_+) = u_C(0_-) = U_0$$

2、 电容并联 (Capacitor in Parallel)

*情况3:各初始电压不相等

求: 开关K闭后的并联等效电路。

采用方法: 电荷守恒

ID:
$$q_c(0_-) = q_c(0_+)$$

$$C_1 u_{C1}(0_-) + C_2 u_{C2}(0_-) = C_1 u_{C1}(0_+) + C_2 u_{C2}(0_+)$$

$$u_{C}(0_{+}) = \frac{C_{1}u_{C1}(0_{-}) + C_{2}u_{C2}(0_{-})}{C_{1} + C_{2}}$$

7.4 电感元件 (inductor)

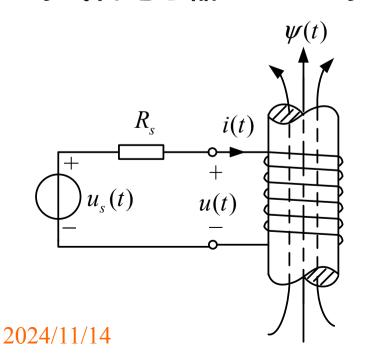

磁芯材料一截面面积S 磁导率 μ

线圈匝数 N

螺线管电感器

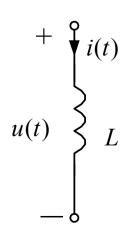

螺线环电感器

电感器结构

线性非时变电感

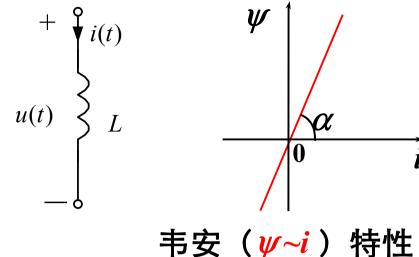

$$\psi(t) = Li(t)$$

电路理论

7.4.1 电感元件的特性 线性非时变电感元件

一. 特性方程

24

线性时不变电感元件的特性曲线性是一条过原点且不随时间变化 的直线。

$$\psi = Li$$

Ψ为电感线圈的磁链

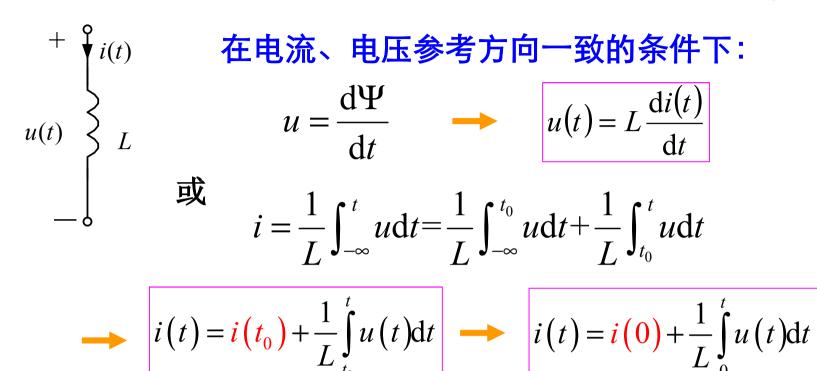

L 称为自感系数

L的单位名称: 亨(利)

符号: H (Henry)

7.4.2 电感的伏安关系:

$$\psi = Li$$

- 电感电压与电感电流的变化率成正比,表明仅当电流变动时才有电压,因此电感元件是一种动态元件。
- 在任意时刻†,电感电流不仅与该时刻电压有关,而且还与/ 以前的电流历史状况有关。因此电感元件是一种记忆元件。

7.4.3 电感的重要性质

$$u(t) = L \frac{\mathrm{d}i(t)}{\mathrm{d}t}$$

1 电感的直流稳态性质

$$i_L(t) =$$
 常数 $\rightarrow u_L(t) = 0 \rightarrow$ 短路

电感在直流电路中相当于短路。

2、电感电流的连续性

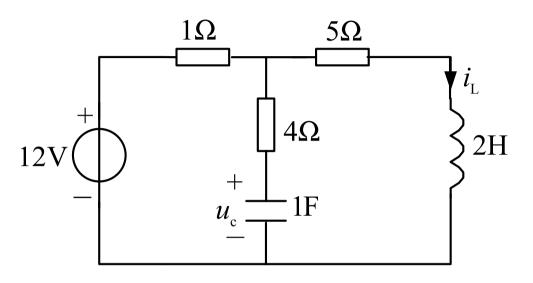

$$i(t) = i(t_{0-}) + \frac{1}{L} \int_{t_0}^t u(t) dt$$
 $u(t_0) \neq \infty$ $i(t_{0-}) = i(t_{0+})$

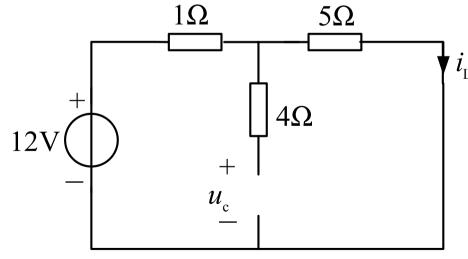

- ▶电感电压在ℓ₀处为有限值,电感电流就在ℓ₀处连续
- ▶电感电压在t₀处为<mark>无限大</mark>,电感电流就在t₀处不连续

7.4.4储能
$$p(t) = u(t)i(t) = Li(t) \frac{di(t)}{dt}$$

$$w(t) = \int_{-\infty}^{t} p(t) dt = \int_{-\infty}^{t} Li(t) \frac{di(t)}{dt} dt = \frac{1}{2} Li^{2}(t) - \frac{1}{2} Li^{2}(-\infty) \quad w(t) = \frac{1}{2} Li^{2}(t)$$

【练习】. 计算 $u_{\rm C}$ 和 $i_{\rm L}$

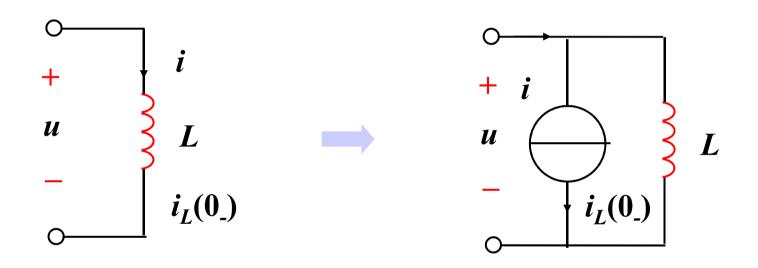

$$i_L = \frac{12}{1+5} = 2A$$

$$u_c = \frac{5}{1+5} \times 12 = 10 \text{V}$$

非零初始电流电感元件的等效电路

$$i_L(t) = i_L(0_-) + \frac{1}{L} \int_{0_-}^t u dt$$

可用一个电流源和一个无初始值的电感并联代替。

2024/11/14 电路理论 28

1. 电感的联接 — 并联 Parallel connection

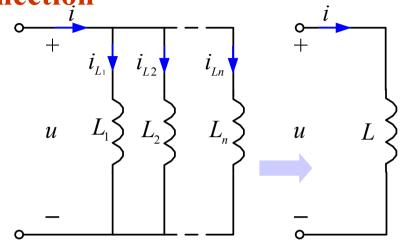

$$i_k(0_+) = i_k(0_-)$$
 $i_k = i_k(0_+) + \frac{1}{L_k} \int_{0_+}^t u dt$

$$i = \sum_{k=1}^{n} i_k = \sum_{k=1}^{n} \left[i_k (0_+) + \frac{1}{L_k} \int_{0_+}^{t} u dt \right]$$

$$= \sum_{k=1}^{n} i_{k} (0_{+}) + (\sum_{k=1}^{n} \frac{1}{L_{k}}) \int_{0_{+}}^{t} u dt$$
$$= i(0_{+}) + \frac{1}{L} \int_{0_{+}}^{t} u dt$$

$$i(0_{+}) = \sum_{k=1}^{n} i_{k}(0_{+}) = \sum_{k=1}^{n} i_{k}(0_{-})$$

$$\frac{1}{L} = \sum_{k=1}^{n} \frac{1}{L_{k}}$$

初始值为0的电感并联,各电感按电感量倒数正比分流。

$$i_k(0_-) = 0 \quad (k = 1, 2, \dots, n)$$

$$i_k = \frac{1}{L_K} \int_{0_+}^t u dt \quad (k = 1, 2, \dots, n)$$

$$i = \frac{1}{L} \int_{0}^{t} u dt \qquad \qquad i_k = \frac{1/L_k}{1/L} i$$

2. 电感的联接 —串联 Series connection

 $i_k(0_-)$ 都相等时:

$$u = \sum_{k=1}^{n} u_k = \sum_{k=1}^{n} \left(L_k \frac{\mathrm{d}i}{\mathrm{d}t} \right)$$

$$= (\sum_{k=1}^{n} L_k) \frac{\mathrm{d}i}{\mathrm{d}t}$$

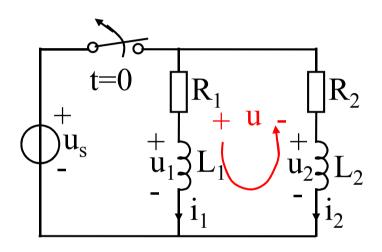

$$L = \sum_{k=1}^{n} L_k$$

$$i\left(0_{+}\right) = i_{k}\left(0_{-}\right)$$

2. 电感的联接 — 串联 Series connection

*(自学)情况2:电流不相等电感的串联

$$i_1(0-) \neq i_2(0-)$$
 $i_1(0_+) = -i_2(0_+)$

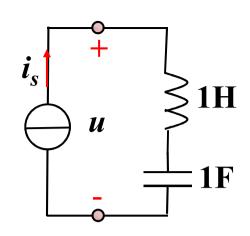

$$\sum_{k=1}^{n} \psi_k(0_+) = \sum_{k=1}^{n} \psi_k(0_-)$$

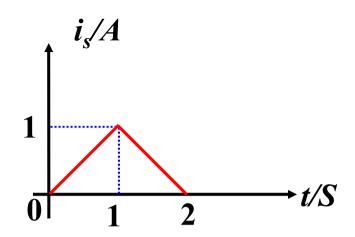

(n为回路包含电感元件的总数)

磁链守恒原理:在集中参数电路中,对包含电感元件的任一回路,若各非电感支路的电压都没有冲击电压产生,则在此回路上的电感的磁通链总量不能突变。

$$(L_1 + L_2)i_1(0_+) = L_1i_1(0_-) - L_2i_2(0_-) \qquad i_1(0_+) = \frac{L_1i_1(0_-) - L_2i_2(0_-)}{(L_1 + L_2)}$$

$$i_s = t[\mathcal{E}(t) - \mathcal{E}(t-1)] - (t-2)[\mathcal{E}(t-1) - \mathcal{E}(t-2)]$$

$$\frac{di_s}{dt} = \varepsilon(t) - \varepsilon(t-1) + t[\delta(t) - \delta(t-1)] = 0$$

$$= 0 - \delta(t-1) - (1-2)\delta(t-1) + 0$$

$$= 0$$

$$-\varepsilon(t-1) + \varepsilon(t-2) - (t-2)[\delta(t-1) - \delta(t-2)] = \varepsilon(t) - 2\varepsilon(t-1) + \varepsilon(t-2)$$

$$\int_{-\infty}^{t} i_{s} dt = \int_{-\infty}^{t} [t\varepsilon(t) - t\varepsilon(t-1) - (t-2)\varepsilon(t-1) + (t-2)\varepsilon(t-2)] dt$$

$$= \left(\int_{0}^{t} t dt\right) \varepsilon(t) - \left[\int_{1}^{t} (t-1) dt\right] \varepsilon(t-1) - \left[\int_{1}^{t} (t-2) dt\right] \varepsilon(t-1) + \left[\int_{2}^{t} (t-2) dt\right] \varepsilon(t-2)$$

$$= \frac{1}{2} t^{2} \varepsilon(t) - \left(\frac{1}{2} t^{2} - t\right) \Big|_{1}^{t} \varepsilon(t-1) - \left(\frac{1}{2} t^{2} - 2t\right) \Big|_{1}^{t} \varepsilon(t-1) + \frac{1}{2} (t-2)^{2} \varepsilon(t-2)$$

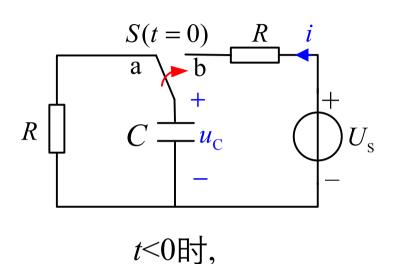

$$= \frac{1}{2} t^{2} \varepsilon(t) - (t-1)(t-2)\varepsilon(t-1) + \frac{1}{2} (t-2)^{2} \varepsilon(t-2)$$

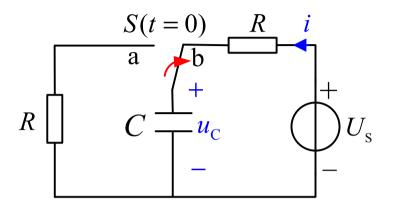

$$u = u_{L} + u_{C} = \frac{di_{s}}{dt} + \int_{-\infty}^{t} i_{s} dt$$

电路理论

7.5 动态电路的暂态分析概述

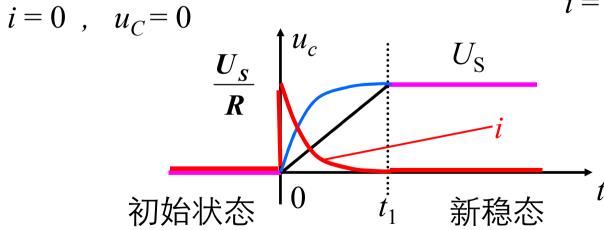

1 暂态过程的概念:

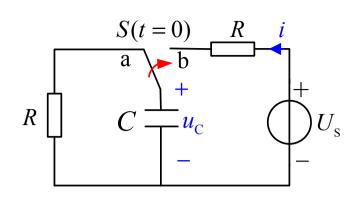

t>0 后很长时间

$$i=0$$
 , $u_C=U_s$

2 暂态过程产生的原因:

1、电路内部含有储能元件 L 、C

能量的储存和释放都需要一定的时间来完成

2、电路结构、状态发生变化

电路中的 u_{i} i在过渡过程期间,从"旧稳态"进入"新稳态",此时 u_{i} i都处于暂时的不稳定状态,

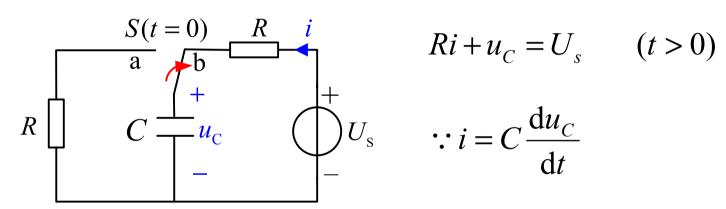

所以<u>过渡过程</u>又称为电路的<u>暂态过程</u>。

7.5.1 动态电路的微分方程 Differential equation

暂态过程分析: 根据基尔霍夫定律, 建立关于待求量(输出量)和 电路中独立电源(输入量)的关系, 称为输入输出方程;

方程为积分或者微分关系,则称为微分方程;

如果该方程为n阶微分方程,则称为n阶电路。

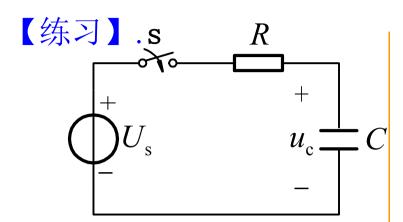

$$Ri + u_C = U_s \qquad (t > 0)$$

$$:: i = C \frac{\mathrm{d}u_C}{\mathrm{d}t}$$

$$\begin{cases} RC\frac{\mathrm{d}u_C}{\mathrm{d}t} + u_C = U_S & (t > 0) \\ u_C(0_+) & \end{cases}$$

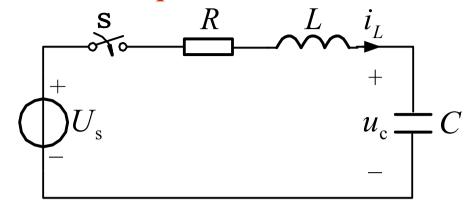

7.5.1 动态电路的微分方程 Differential equation

$$Ri_{C} + u_{C} = U_{s} \qquad t > 0$$

$$RC \frac{du_{C}}{dt} + u_{C} = U_{s} \qquad t > 0$$

- 不同的变量,相同 的齐次微分方程!
- 微分方程的阶数 = 电 路的阶数!
- 电路的阶数 = 独立动态元件个数

$$Ri_{L} + u_{L} + u_{C} = U_{s} \qquad t > 0$$

$$Ri_{L} + L \frac{di_{L}}{dt} + \frac{1}{C} \int_{-\infty}^{t} i_{L} dt = U_{s} \quad t > 0$$

$$LC \frac{d^{2}i_{L}}{dt^{2}} + RC \frac{di_{L}}{dt} + i_{L} = 0$$

$$RC\frac{\mathrm{d}u_C}{\mathrm{d}t} + L\frac{\mathrm{d}}{\mathrm{d}t}(C\frac{\mathrm{d}u_C}{\mathrm{d}t}) + u_C = U_\mathrm{s}$$
 $t > 0$

$$LC\frac{\mathrm{d}^{2}u_{C}}{\mathrm{d}t^{2}} + RC\frac{\mathrm{d}u_{C}}{\mathrm{d}t} + u_{C} = U_{s}$$

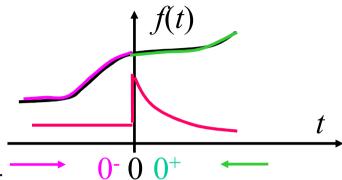

电路理论

2024/11/14

7.5.3 初始值 (Initial condition)

电量原始值和初始值的概念

换路在 t=0时刻进行

- 0 换路前一瞬间,原始值
- 0+ 换路后一瞬间,初始值

$$f(0^{-}) = \lim_{\substack{t \to 0 \\ t < 0}} f(t) \qquad f(0^{+}) = \lim_{\substack{t \to 0 \\ t > 0}} f(t)$$

初始值为 t = 0+时u, i 及其各阶导数的值

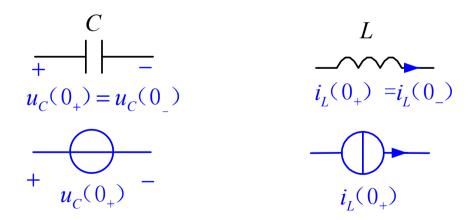

一阶:
$$f(0^+)$$
; 二阶: $f(0^+)$, $f'(0^+)$;

N阶:
$$f(0^+)$$
, $f'(0^+)$... $f^{(n-1)}(0^+)$ 。

7.5.4 换路规律:初始值的计算

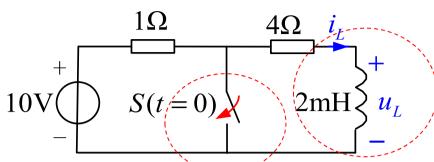

确定初始值的步骤

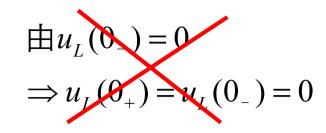

- 确定电路t=0 时刻的 $u_C(0)$ 和 $i_L(0)$;
- 电容电压连续性: $u_C(0_+)=u_C(0_-)$; 电感电流连续性: $i_L(0_+)=i_L(0_-)$.
- 画出0+时刻等值电路:应用替代定理,电容用电压源代替, 电感用电流源替代;

• 由0+电路求所需各变量的0+值。

【例1】. t = 0时闭合开关S,求 $u_L(0_+)$?

0.等效电路

解:

(1) 由0_电路求 i_L(0_)

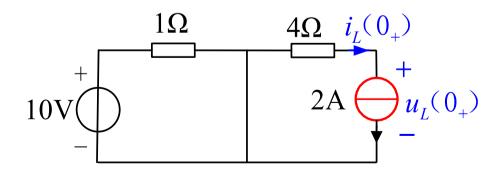

$$i_L(0_{-}) = 10/(1+4) = 2A$$

(2) 由电感电流的连续性得:

$$i_L(0_+) = i_L(0_-) = 2A$$

(3) $t=0_+$ 等效电路求 $u_L(0_+)$:

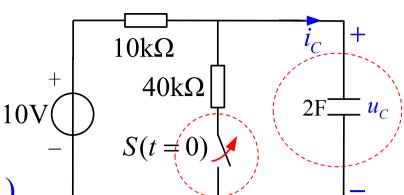

$$u_L(0_+) = -2 \times 4 = -8 \text{ V}$$

0,等效电路

2024/11/14

(1) 由0_电路求 $u_{C}(0)$

$$u_{C}(0)=8V$$

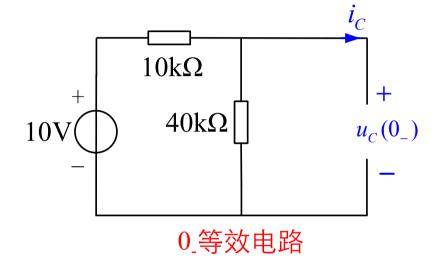

(2) 由电容电压的连续性得:

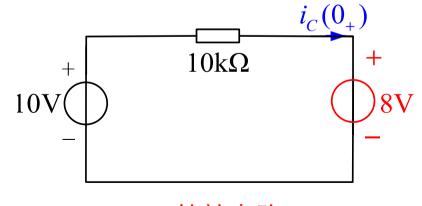

$$u_C(0_+) = u_C(0_-) = 8V$$

(3) 由 0_+ 等效电路求 $i_C(0_+)$

$$i_C(0^+) = \frac{10-8}{10} = 0.2 \text{mA}$$

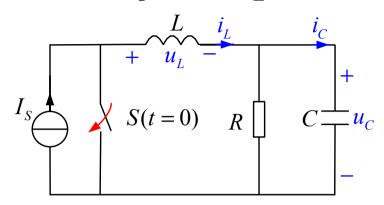

$$i_{C}(0_{-})=0 \Rightarrow i_{C}(0_{+})$$

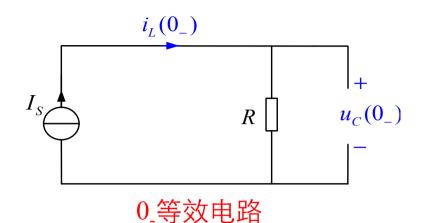

0,等效电路

【例3】.求 $i_C(0_+)$, $u_L(0_+)$?

- (1) 由0.电路求 $i_L(0)$ 、 $u_C(0)$ $i_L(0) = I_S$ $u_C(0) = RI_S$

$$u_C(0_{-}) = RI_S$$

(2) 由电容电压和电感电流的连续性计算 $i_L(0_+)$ 、 $u_C(0_+)$:

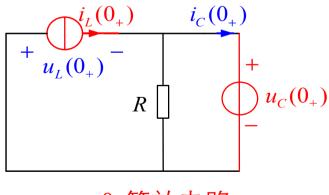

$$i_L(0_+) = i_L(0_-) = I_S$$

$$i_L(0_+) = i_L(0_-) = I_S$$
 $u_C(0_+) = u_C(0_-) = RI_S$

(3) 0+电路

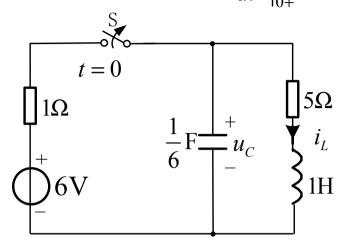

$$i_C(0_+) = I_s - \frac{RI_S}{R} = 0$$

$$u_L(0_+) = -RI_S$$

0_等效电路

【例4】.开关S打开前电路处稳态,求 $u_C(0+)$ 、 $i_L(0+)$ 、 $\frac{\mathrm{d}u_C}{\mathrm{d}t}$ 。

解:

由电容电压和电感电流的连续性计算 $i_L(0_+)$ 、 $u_C(0_+)$:

$$u_C(0_+) = u_C(0_-) = 1 \times 5 = 5$$

$$i_L(0_+) = i_L(0_-) = \frac{6}{6} = 1$$

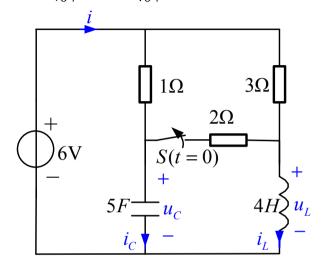

$$\frac{du_C}{dt}\Big|_{0_+} = -\frac{i_C(0_+)}{C} = -\frac{i_L(0_+)}{C} = -6$$

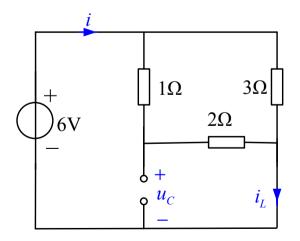

【练习】. 开关S 打开前电路处稳态,t=0时刻开关打开,求

$$u_{C}(0_{+}), i_{L}(0_{+}), i_{C}(0_{+}), u_{L}(0_{+}), i(0_{+}), \frac{du_{C}}{dt}\Big|_{0_{+}}, \frac{di_{L}}{dt}\Big|_{0_{+}}, \frac{di_{C}}{dt}\Big|_{0_{+}}$$

解: 0-时刻等效电路
$$u_C(0_+)=u_C(0_-)=\frac{2}{1+2}\times 6=4V$$

$$i_L(0_+)=i_L(0_-)=\frac{6}{(1+2)/3}=4A$$

【练习】. 开关S 打开前电路处稳态,t=0时刻开关打开,求

$$u_{C}(0_{+}), i_{L}(0_{+}), i_{C}(0_{+}), u_{L}(0_{+}), i(0_{+}), \frac{du_{C}}{dt}\Big|_{0_{+}}, \frac{di_{L}}{dt}\Big|_{0_{+}}, \frac{di_{C}}{dt}\Big|_{0_{+}}$$

解: 0-时刻等效电路

$$u_C(0_+) = u_C(0_-) = \frac{2}{1+2} \times 6 = 4V$$
 $i_L(0_+) = i_L(0_-) = \frac{6}{(1+2)/3} = 4A$

0+时刻等效电路

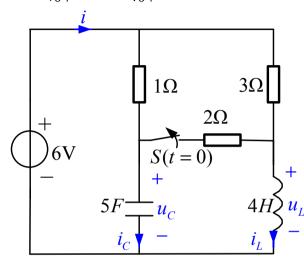

$$i_C(0_+) = \frac{6-4}{1} = 2 \text{ A}$$
 $u_L(0_+) = 6-3 \times 4 = -6 \text{ V}$

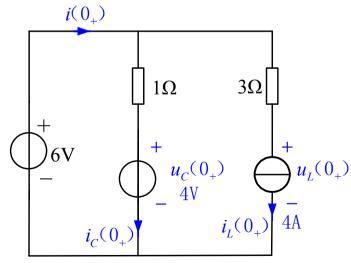

$$i(0_+) = i_C(0_+) + i_L(0_+) = 2 + 4 = 6 \text{ A}$$

$$\frac{du_C}{dt}\Big|_{0^+} = \frac{1}{C}i_C(0_+) = 0.4 \text{ V/s}$$

$$\left. \frac{di_L}{dt} \right|_{0^+} = \frac{1}{L} u_L(0_+) = -1.5 \text{ A/s}$$

$$1 \times i_C + u_C = 6 \qquad \frac{di_C}{dt} + \frac{du_C}{dt} = 0 \quad \Rightarrow \frac{di_C}{dt} \Big|_{0^+} = -0.4 \text{ A/s}$$

【练习】.计算
$$u_{C}(0_{+})i_{L}(0_{+})$$
 $i_{1}(0_{+})i_{2}(0_{+})$ $u_{C}(\infty)i_{1}(\infty)i_{2}(\infty)$

【练习】.计算
$$u_{C}(0_{+})i_{L}(0_{+})$$
 $i_{1}(0_{+})i_{2}(0_{+})$ $u_{C}'(0_{+})i_{L}'(0_{+})$ $i_{L}'(0_{+})$ $i_{L}'(0_{+})$

原始状态original state, 0-等效电路

$$i_L(0_-) = 2A$$
 $u_C(0_-) = 3V$

$i_1 \quad \underline{5\Omega}$ 10V

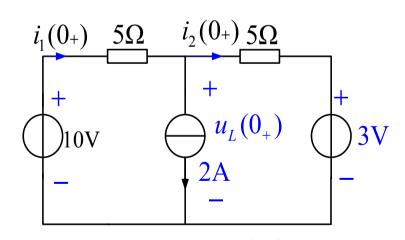

初始状态initial state (连续性)

$$i_L(0_+) = i_L(0_-) = 2A$$

 $u_C(0_+) = u_C(0_-) = 3V$

初始值initial value, 0+等效电路

$$\begin{cases} i_1(0_+) = 2 + i_2(0_+) & i_1(0_+) = 1.7A \\ 10 - 3 = 5i_1(0_+) + 5i_2(0_+) & i_2(0_+) = -0.3A \end{cases}$$

0,等效电路

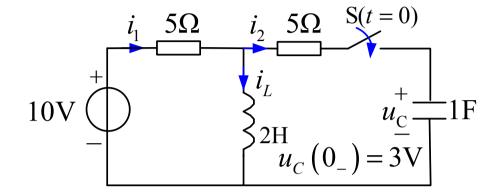

$$u_{C}'(0_{+}) = \frac{i_{C}(0_{+})}{C} = -0.3 \qquad i_{L}'(0_{+}) = \frac{u_{L}(0_{+})}{L} = \frac{5 \times (-0.3) + 3}{2} = 0.75$$

$$\frac{2024/11/14}{2} = \frac{45}{2}$$

【练习】.计算
$$u_{C}(0_{+})i_{L}(0_{+})$$
 $i_{1}'(0_{+})i_{2}'(0_{+})$

$$\begin{cases} i_1 = i_2 + i_L \\ 10 = 5i_1 + 5i_2 + u_C \end{cases}$$

$$10i_1 - 10 = 5i_L - u_C$$

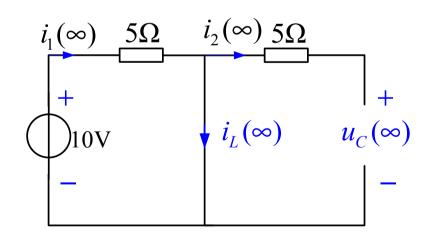

$$i_1'(0_+) = 0.5i_L'(0_+) - 0.1u_C'(0_+) = 0.405$$

稳态值 Steady-state value:

$$i_L(\infty) = \frac{10}{5} = 2A$$

$$i_1(\infty) = i_L(\infty) = 2A$$

$$i_2(\infty) = 0$$
 $u_C(\infty) = 0$

∞等效电路

7.5.5 暂态过程计算

微分方程 (Differential equation)

初始值 (Initial value)

【例5】. t=0时, 开关S换路,求 i_{L}

1建立微分方程

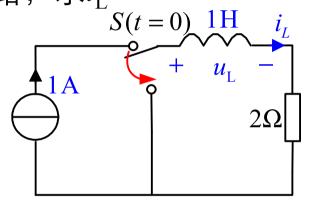

$$u_L + Ri_L = 0$$
 $t > 0$

$$\frac{di_L}{dt} + 2i_L = 0 \quad t \ge 0$$

2 求解初始值

$$i_L(0_+) = i_L(0_-) = 1 A$$

3 求解微分方程

$$\begin{array}{c|c}
1H & i_L \\
+ & u_L & -
\end{array}$$

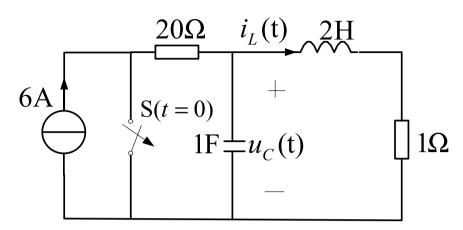

$$2\Omega \left[i_L(0_+) = I_0 \right]$$

$$s + 2 = 0 \implies s = -2$$

$$i_L = Ke^{st} = Ke^{-2t}A = e^{-2t}A \quad (t \ge 0)$$

$$u_L = -2i_L = -2e^{-2t} \text{ V}$$
 $(t > 0)$

【例6】. t=0时, 开关S打开,求 i_{T}

解: 1建立微分方程

KCL:
$$6 = i_L + \frac{du_C}{dt}$$
KVL:
$$2\frac{di_L}{dt} + i_L = u_C$$

$$2\frac{d^2i_L}{dt^2} + \frac{di_L}{dt} = \frac{du_C}{dt}$$

2 求初始值及特解

$$i_L(0_+) = 0$$
 $i'_L(0_+) = 0$ $i_L(\infty) = 6A$

 $2\frac{\mathrm{d}^2 i_L}{\mathrm{d}t^2} + \frac{\mathrm{d}i_L}{\mathrm{d}t} + i_L = 6$

3 求解微分方程

求解微分方程
$$s_{1,2} = \frac{-1 \pm j\sqrt{7}}{4}$$

$$i_L(t) = i_{Lp}(t) + i_{Lh}(t) = 6 + Ae^{-\frac{1}{4}t} \cos(\frac{\sqrt{7}}{4}t + \theta)$$

由初始条件确定待定常数: A = -6.41 $\theta = -20.7$ °

计划学时:5学时;课后学习15学时

作业:

7-2 /奇异函数

7-15/ 电容的特性

7-26/ 电感的特性

7-35、7-36/微分方程,初态、终态

(7-36第6问正确系数为: -8.49, 0.49)

7-18、7-31/选做题
